

Surface Simplification (Gueziec's Method)

600.445

Gueziec's Method

- Reference
 - A. Gueziec, “Surface Simplification inside a tolerance volume”, *IBM Research Report RC20440*, 5/20/97
- Essentially “triangle decimation” done correctly
 - Preserves topology
 - Preserves volume
 - Provable error bound

Simplified surfaces

Algorithm outline

Until Queue/ Last Bucket Empty:

- Take edge with low(est) weight
- If edge can be safely collapsed
 1. If valence does not exceed maximum
 2. If simplified vertex is regular
 3. If triangle normal rotation is acceptable
 4. If triangle compactness is acceptable
 5. If error does not exceed tolerance
 - Change neighboring configuration
 - Remove all edges of the star from the queue
 - Reinststate new edges in the queue
- Else
 - remove edge from queue

Picking new vertex to preserve volume

Volume associated with edge star is sum of tetrahedra

v_0 = vertex associated with simplified vertex star

g_0 = centroid of edge star

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Picking new vertex to preserve volume

Given edge star $(v_1, v_2)^* = \{v_3, \dots, v_n\}$. Let T_{12}

be the set of all triangles t in $v_1^* \cup v_2^*$ and let

$vertices(t) = \{v_{t1}, v_{t2}, v_{t3}\}$ be the set of vertices

associated with a triangle t . Compute the centroid

$g = \sum_{i=3}^n \frac{v_i}{n-2}$ of $(v_1, v_2)^*$. Then the volume associated

with the $(v_1, v_2)^*$ is

$$V_{1,2} = \sum_{t \in T_{12}} V_{tetra}(g, v_{t1}, v_{t2}, v_{t3})$$

We want to pick v_0 such that

$$\sum_{i=3}^{n-1} V_{tetra}(g, v_0, v_i, v_{i+1}) = \sum_{t \in T_{12}} V_{tetra}(g, v_{t1}, v_{t2}, v_{t3})$$

Volume of a tetrahedron

$$V_{tetra}(v_0, v_1, v_2, v_3) = \frac{1}{6} (v_1 - v_0) \bullet (v_2 - v_0) \times (v_3 - v_0)$$

Engineering Research Center for Computer Integrated Surgical Systems and Technology

Picking new vertex to preserve volume

- Volume preservation constraint defines a plane on which v_0 must lie.
- Select the point on this plane that minimizes sum-of-squared distance to planes of all triangles being collapsed

Triangle compactness improvement

Figure 11: A visual inspection of these triangles extracted from the shaft of the Femur model shows that facets are more regular in the simplified femur model produced by the our algorithm (Right) than they are in the original output of an iso-surface algorithm (Left). In particular, most “sliver” (very narrow) triangles have been removed. Histograms of triangle compactness presented in Fig.10 confirm this observation.

Error Volume & tolerance volume

Figure 12: A: Error volume, in green (A1), centered on the simplified surface (A2). The original surface (here, curve) is not only contained in the error volume, in dashed red (A3), but also intersects all the spheres, in blue (A4). B: Tolerance volume, in blue (B1), centered on the original surface (B2). The simplified surface (B3) is contained inside the tolerance volume and intersects all the spheres. C: The final error volume contains all the intermediate error volumes. D: The initial tolerance volume contains all the intermediate tolerance volumes. A simplification operation is rejected if the width of the resulting tolerance volume is negative.
